

User Story

As a registered bank customer,

I want to securely sign up, authenticate, view my balance, transfer funds, and manage my account via the BrowserStack Bank mobile app,

So that I can perform everyday banking tasks conveniently and securely from my mobile device.

Feature Overview

High Priority

Authentication — Sign up with email/password, OTP verification (backend), biometric (Face ID / Fingerprint), liveness check

KYC / Identity — Document upload (file picker), camera-based liveness video capture

Home Dashboard — Balance card (passcode-protected reveal), recent transactions, QR scanner, IP geolocation badge, notifications

Transfers & Payments — Send money to recipients, Stripe card payments, quick-amount shortcuts, transaction auth modal

Medium Priority

Transaction History — Filterable list (All / Credit / Debit / Transfer / Payment) with category icons

Profile & Settings — Edit profile, Green Mode theme toggle, delete account, verification checklist

Cards — View and manage virtual/physical cards

Admin Panel — User management, transaction oversight, feature controls

Low Priority

Currency Converter — Real-time currency conversion using IP-detected locale

AI Chat — In-app banking assistant chat

Acceptance Criteria

Authentication

User can sign up with full name, email, and password; OTP is sent and validated via backend.

User can log in with email/password and is redirected to the home dashboard on success.

Biometric (Face ID / Fingerprint) setup is offered as an optional step during sign-up.

Liveness check (camera video capture) is completed before account activation when enabled.

Invalid credentials show a clear error message; account is not created on validation failure.

Home Dashboard

Balance is hidden by default and revealed only after passcode/biometric confirmation (once per session).

Recent transactions (last 4) are displayed with amount, category icon, and date.

QR scanner opens a modal; scanned result is displayed to the user.

Location badge shows city/country detected via IP geolocation.

Transfers & Payments

User can select a recipient from the list and enter an amount to send.

Quick-amount buttons (50, 100, 250, 500) pre-fill the amount field.

Transaction auth modal (biometric or PIN) is shown before confirming a transfer.

Stripe payment sheet is presented for card-based payments; success/failure is handled gracefully.

Balance is updated in real time after a successful transfer.

Transaction History

All transactions are listed with filter tabs: All, Credit, Debit, Transfer, Payment.

Selecting a filter shows only matching transactions; "All" resets the view.

Profile

User can update their display name and profile details.

Green Mode theme toggle persists across sessions.

Delete account action requires confirmation and clears local session data.

Technical Stack

Framework — React Native (Expo, file-based routing via expo-router)

State Management — Custom stores (AuthStore, BankStore, ThemeStore)

Backend API — Node.js / Express hosted on Render

Payments — Stripe React Native SDK

Biometrics — expo-local-authentication

Camera / Media — expo-camera, expo-image-picker

Push Notifications — Firebase

Database — Neon (PostgreSQL serverless)

CI / Testing — BrowserStack App Automate

Out of Scope

Web / browser version of the app

Multi-currency account creation

Loan / credit product flows

Third-party bank integrations (Open Banking)

Definition of Done

All acceptance criteria pass on Android (Samsung Galaxy S24) and iOS (iPhone 15) via BrowserStack.

No P1/P2 bugs open against this story.

Automated smoke tests cover auth, balance reveal, and transfer flows.

Code reviewed and merged to main.
